

Continuing Practicum 2018

Description of Purpose and Focus

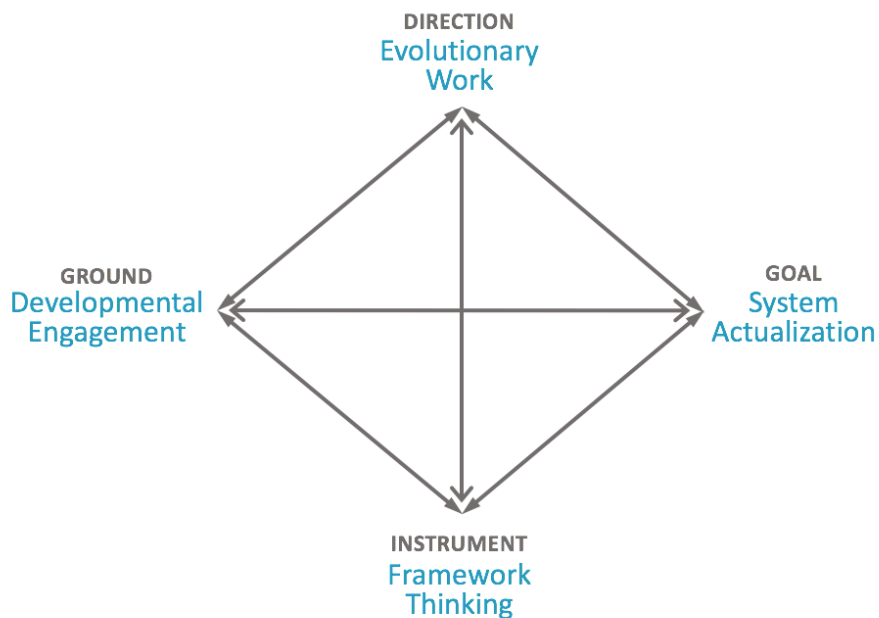

Purpose we are working toward in the Continuing Practicum:

- To develop the capacity to generate and regenerate in ourselves the nature and quality of being and thinking required of a regenerative practitioner...
- In a way that we increasingly become captains of our own continuing evolution, through continually regenerating the value of the way we work, what we produce and the capabilities we bring to that.

Guiding tetrad for the practicum

The below tetrad depicts the four processes or ways of working we need to be continually building capability in if we are to grow ourselves as regenerative practitioners.

REGENERATIVE PRACTICE

- **Developmental Engagement:** Designing processes for bringing out the ableness in something—increasing its potential and the possibilities for what it can be.
- **System Actualization:** Developing more effective systems that increase the level of value inherent in what we produce.
- **Evolutionary Work:** Growing an entity’s capacity to actualize something of greater magnitude into new arenas or new environments.
- **Framework Thinking:** Developing the mind that can work from a state of consciousness and create the ideas we want to give birth to.

We will start off the Continuing Practicum at the instrument point of the tetrad -- framework thinking, based on the premise: *When we lose the capacity to work from a state of consciousness, all the fuel required for regenerative work evaporates.*

Content of the sessions

The February session introduces the *Scope of Consciousness*, a foundational framework in the thinking technology behind regenerative development. This framework depicts the interrelationship of the three components that make up any thought. As an assessment and calibration instrument, it helps develop the understanding of the relational dynamics of these three, and provides a basis for consciously growing the power and quality of our thinking, individually and in groups—a first step in designing developmental processes.

We'll work with the Scope of Consciousness framework for the first few sessions, and then introduce new frameworks in subsequent sessions based on the faculty's emerging sense of what the participants are working on and what material would be best suited to that work. We will use breakout groups and provide exercises with the driving intention of supporting participants in applying these frameworks to real-work situations, in real time.
